

B2C Shipment API Integration Guide

1. Introduction

This guide provides the necessary information to integrate the Create B2C Shipment API into your application. This API allows sellers to programmatically generate shipping orders.

2. API Endpoint & Methods

- **Endpoint URL:** https://shipcorrect.com/api/create_order_b2c.php
- **HTTP Method:** POST
- **Content-Type:** application/json

3. Authentication

Authentication is handled via the `api_key` provided in the JSON body of your POST request. Ensure this key is kept confidential.

4. Parameter Reference

Parameter	Required	Description
api_key	Yes	Your unique seller API key.
customer_name	Yes	Full name of the receiver.
customer_address1	Yes	Primary delivery address.
customer_address_pincode	Yes	6-digit delivery pincode.
customer_contact_number1	Yes	Primary 10-digit mobile number.
product_name	Yes	Name/description of the item.
product_weight	Yes	Dead weight of the product in kg.
pay_mode	Yes	Payment method (Prepaid/COD).
quantity	Yes	Number of units.

Parameter	Required	Description
total_amount	Yes	Total value of the shipment.
length	Yes	Package length in cm.
breadth	Yes	Package breadth in cm.
height	Yes	Package height in cm.
pickup_id	Yes	Warehouse ID for pickup.
customer_email	No	Recipient email.
customer_address2	No	Secondary address details.
customer_address_landmark	No	Nearby landmark.
customer_contact_number2	No	Alternative contact number.
product_id	No	Internal product ID.
sku	No	Stock Keeping Unit.
mrp	No	Maximum Retail Price.
client_order_no	No	Internal order reference.

5. Example JSON Payload

JSON

```
{  
  "api_key": "YOUR_SECRET_KEY_HERE",  
  "customer_name": "John Doe",  
  "customer_email": "john.doe@example.com",  
  "customer_address1": "123, Maple Street",  
  "customer_address2": "Apt 4B",  
  "customer_address_landmark": "Near Central Park",  
  "customer_address_pincode": "400001",  
  "customer_contact_number1": "9876543210",  
  "customer_contact_number2": "9123456789",  
  "product_id": "PROD-101",  
  "product_name": "Wireless Mouse",  
  "sku": "WM-99-BL",  
  "mrp": 1200.00,  
  "product_weight": 0.5,  
  "pay_mode": "Prepaid",  
  "quantity": 1,  
  "total_amount": 999.00,  
  "client_order_no": "ORD-2026-001",  
  "length": 10,  
  "breadth": 10,  
  "height": 5,  
  "pickup_id": "WH-001"  
}
```

6. API Response Handling

The API returns a JSON response indicating whether the shipment request was processed successfully or if validation errors occurred. You should parse the status field to determine the outcome.

Success Behavior:

When the request is successful, the API returns a status of "success" along with a unique order_no. You should store this order_no in your database for future tracking and reference.

JSON

```
{  
  "order_no": 20983673,  
  "status": "success"  
}
```

Error Behavior:

If the request is missing mandatory fields, fails authentication, or contains invalid data, the API will return a status of "error", an error_message, and an errors array providing a detailed list of which fields failed validation.

JSON

```
{  
  "status": "error",  
  "error_message": "Validation failed",  
  "errors": [  
    "customer_address_pincode is required.",  
    "customer_contact_number1 is required."  
  ]  
}
```
